

INSIGHTS FROM IPSOS'
GLOBAL CONSUMER
OBESITY STUDY

The clinical success of GLP-1s in obesity management is well documented, but what about the experiences of those who take them?

## 73% of the US consumers we surveyed strongly agreed that obesity is a major health issue in their country that needs more attention.

**Source:** Ipsos Global Consumer Obesity Study (1,750 consumers in US providing perceptions online from Dec '23 – Jan '24), Data © Ipsos 2024, all rights reserved

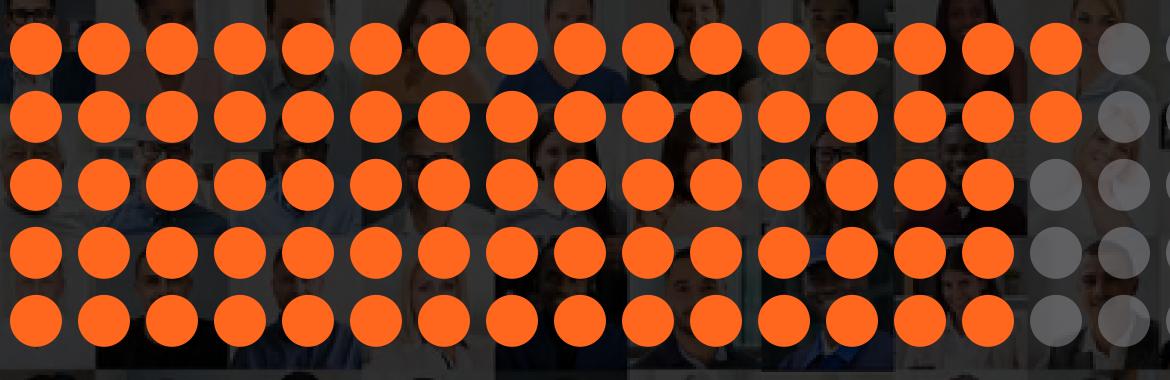

However, potential barriers to uptake of obesity medications were evident...

Consumers who were eligible for GLP-1 treatment\* noted 'possible side-effects', 'high costs' and 'regaining weight after stopping medication' as key concerns.

In terms of altered food preferences, 49% of the GLP-1 users\* reported a reduced consumption of 'snack foods' while on their current prescription medication for weight loss.

Among the GLP-1 users overall, there was an increase in consumption of certain products that may help with the management of treatment side-effects and weight control.

Ipsos' suite of syndicated obesity studies can help you understand and plan for these shifting needs.
